An Innovative Approach: Teaching Programming Languages Using A Second Language Acquisition Theory

Paula Sanjuan Espejo, Undergraduate Research Assistant. Aerospace Engineering Department

Introduction to Computing for Engineers, EGR 115, has proven to be a challenging course for many students, especially if it is their first contact with programming languages. The purpose of Second Language Acquisition Applied to Blended Learning Environments (SLA-able) is to make the process of learning MATLAB in hybrid courses more intuitive.

The hybrid course material aims to enhance students’ understanding of the challenging, logic oriented concepts by integrating Second Language Acquisition (SLA) theory into programming language study. This approach is based on emphasizing the problem-solving techniques necessary in these courses and approaching programming languages as new written or spoken languages with their own syntax, vocabulary and punctuation.

### Introduction

- The first contact with programming languages has proven to be intimidating for students, causing it to create an impression of programming as a tedious and over-complicated. This affects the performance and implication of students in these classes, which directly affects their understanding of concepts they will need for future courses.

### SLA-able

- Second Language Acquisition Applied to Blended Learning Environments (SLA-able) takes a more intuitive approach to this learning process, breaking concepts into more elementary pieces and testing students frequently on their knowledge in small and simple blocks. Once the base for each topic is established, problem-solving techniques are emphasized before moving into problems with increasing difficulty.

- Programming is approached as a second language, applying the five stages of second language acquisition (Figure 1) to programming languages (Table 1).

### Materials and Methods

- The four blocks of topics developed are:
  - Introduction to MATLAB
  - Script Files, Data-Types and Variables
  - If statements
  - Loops: While and For

### Discussion Board, 2015

- Portal for students to interact with each other, sharing examples and asking questions about the online topics.
- Monitored by the research assistants with help from professors.
- Participation required.
- Participation beyond the baseline included any comments, questions, or answers to other, students posts beyond the required single post or response (Figure 3).
- Due to feedback of high workload participation optional Spring 2016.

### Results

<table>
<thead>
<tr>
<th>Grades (100 points max.)</th>
<th>Input Function</th>
<th>Advanced if Statement</th>
<th>While Loop General</th>
<th>While Loop, Catching Errors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non SLA-able control section</td>
<td>81.00</td>
<td>82.96</td>
<td>88.76</td>
<td>79.69</td>
</tr>
<tr>
<td>SLA-able section</td>
<td>86.50</td>
<td>90.84</td>
<td>90.71</td>
<td>82.64</td>
</tr>
</tbody>
</table>

### Future Work

- Submit videos: for international students, for better and clearer understanding.
- Design changes to slides: Add examples as extra material.
- Shorten length. Add music.
- New approach to collecting feedback. Embedded in videos, include questions at the end.
- Modify quizzes reducing workload. Focus this change on open-ended questions.
