The complexities of modern society and the dynamic forces of progress necessitate that professionals in every discipline be forward-focused, which is believed to come from gaining higher education. This is becoming standard within the fire and emergency services professions and is commonly a factor regarding upward mobility. With that in mind, the U.S. Fire Administration/National Fire Academy (NFA) developed the Fire and Emergency Services Higher Education (FESHE) recognition certificate. FESHE recognition acknowledges that colleges and universities are committed to the academic excellence of professional development education criteria set forth by the FESHE committees. FESHE recognition is an important part of the FESHE mission, for it is believed necessary to advance the profession by increasing the body of knowledge (Smedley, Luton, Lutz, Doris, 2005). All FESHE core curriculum courses have a research component to them — Associates and Bachelor level courses. These assist the students in learning the basics of research: selection of topic, locating credible sources of data, synthesizing information, compiling an assignment, and citing sources. An example of an online resource center available to everyone is the National Emergency Training Center Learning Resources Center (NETC-LRC), maintained by the NFA. It is through this research portal that materials on all subjects pertaining to fire and emergency services can be found (USFA, 2012). In addition, the LRC maintains a collection of dissertations and theses written by academics and professionals in the field.

The NFA released a report on March 1st of this year which compiled institutions of higher learning having achieved the FESHE recognition and regional accreditation. The FESHE certificate represents that the program being offered meets the “minimum standards of excellence” set by the National Fire Academy for academic degrees. The report also lists colleges or universities which are regionally accredited. Accreditation reflects that the program is recognized by the Council of Higher Education Accreditation (CHEA) and the U.S. Department of Education. This is becoming standard within the field.

Research is a partner — rooted in scientific method, it is essential to continuously organizational and process improvement (Gunderson & Lindsay, 2011). As an example, fundamentals of physics and chemistry must be applied to increasingly multi-faceted situational parameters within diverse social constructs. Coupled with competitive economic conditions and higher professional standards, “non-traditional” adult students are seeking to augment experience with academic achievement (Moarsh, 2008).

The National Fire Academy (NFA) estimates that there are more than 1.1 million firefighters in the United States, with more than 600,000 of age 50 and over (USFA, 2012). The demographics suggest a transition to less physically-demanding roles, while leveraging individual and institutional “history” as a win-win for the professional as a whole.

The type of research conducted within the fire and emergency services varies from current topics within local level organizations: staffing, correlation response times and losses, impact of education via simulation only for fire training, those on a more of a state/national level: standardized testing, feasibility of national response time to major disasters, technological advancements used to assist in incidents (OFA, 2013). Research is an interesting time of change for the fire and emergency management area. We are moving toward a forward-focus rooted in academic research combined with innovation which leverages science and technology. It certainly is a recipe for superior stewardship of the profession in this millennium.

Professor Gorman is an Associate Fire Science Program Chair at Embry-Riddle Aeronautical University (ERAU). Before coming to ERAU, she spent 27 years as a geologist in the environmental sector, responsible for regulatory development, emergency pollution response, incident investigation and remediation, disaster planning, and hazardous materials/solid waste management.

Dr. Herron is an Associate Fire Science Program Chair at Embry-Riddle Aeronautical University (ERAU). Her Ph.D. is from Florida State University, where she worked prior to coming to ERAU. She has been at ERAU for seven years, in which time she served as the Interim Dean of Online Instruction and has maintained an active status on various University committees regarding online learning and academic technology advancement.

There’s more than one ladder to climb in this career.

For years, you’ve put your life on the line to take care of your community. Now it’s time to take care of your career and your future. With a degree from Embry-Riddle Aeronautical University – Worldwide, you’ll gain the knowledge and earn the credentials that will help you get ahead. Taught by instructors with real-world experience and offering online classes that are relevant and convenient, Embry-Riddle Worldwide’s Bachelor of Science in Fire Science is the degree that will help you climb the ladder and advance your career.

This B.S. in Fire Science is one of only a few universities to programs to carry the “Certificate of Recognition” from the Fire and Emergency Services Higher Education (FESHE). The program is based on the FESHE model degree curriculum, and addresses all the critical areas that modern fire departments are tasked to perform.
