Abstract
Our work is to build a versatile chamber that is capable of allowing experiments for any component needed in an advanced life support system while maintaining a much lower cost compared to a similar commercial product. We plan to use the chamber for conducting experiments on living plants and microbial life in a stable environment. These experiments will further research toward a bio-regenerative life support system capable of allowing humans explore beyond Earth. Our system is designed to control temperature, atmospheric composition, air flow, ambient pressure, water distribution, and light intensity. With these factors, the experiments can more closely mimic the environment of Mars, test the ability of an aeroponics growth system for plants, or even use a previously built-in-house clinostat to achieve hypogravity testing. Beyond our own research, the team will be working towards commercializing the device as it is needed for most experiments to ensure a consistent environment.

Materials and Methods

Structure
- Woven Fiberglass (GFRP)
- Chopped Mat GFRP
- Coosa Bluewater Board
- Polyester Resin / Hardener

Hardware / Software
- Electronics (below)
- Water pump / Piping
- Vacuum Pump
- Raspberry Pi
- Fan
- Arduino
- Peltier Heater / Cooler

The structure will consist of four layers of chopped mat, two layers of woven fabric, and a 1/2” Coosa board. The board can be used as the mold for the fabrics. Materials are currently being purchased for pressurization testing.

Future Work
Following the construction of the walls, hardware will be integrated with systems capable of conducting hydroponic or aeroponic research. Beyond this integration, the chamber will be outfitted with a custom sensor suite, a vacuum pump, and additional materials to ensure controlled environmental conditions. Experiments will consist of plant growth in altered environments, cyanobacteria growth, and efficiency testing for power. Behind our own testing, other academics could potential use this device for innumerous amounts of research.
