**METHODOLOGY**

“Triangulation is the process of corroborating evidence from different individuals (e.g. interviewing both a principal and a student), types of data (e.g. observational field notes and interviews), or methods of data collection (e.g. documents and interviews)” (Creswell, 2012, p. 259). The three methods of data collection used in this study are interviews, artifacts, and literary review.

- **Interviews**: Five interviews were performed during the trip to Havana:
  - Employee of a Cuban and Canadian petroleum collaboration
  - Electrician of the Cuban National Power Grid
  - Hostel Owner in Viñales
  - Cuban Tour Guide
  - Professor of Economy at the University of Havana

- **Artifacts**: Observations were collected on planned excursions and independent explorations of Havana.

- **Literary Review**: Data that could not be collected through qualitative methods was collected from online sources.

- **Personal blogs, online Havana news sources, and other primary sources**

**ABSTRACT**

Cuba’s national pride comes from their projected autonomy as a communist country, although they have been dependent on other countries to supply them with resources since the revolution. However, Cuba has a high capacity for various forms of renewable energy. This study analyzes the impacts of Cuba’s decline in petroleum use and the rise of renewable energy. There is a lack of primary research on Cuba’s energy infrastructure because of government censorship, so this study utilizes accounts from Cuban citizens as well as first-hand observations of the country. Research was conducted through interviews, observations, and written accounts of life in Cuba. The decline of Cuba’s use of petroleum has led to an emphasis on sustainability, affecting people’s lifestyles and the economy. The inability to produce enough electricity has created an inequality between those who are involved in tourist industries and those who are not. However, the dawn of renewable energy is helping to close that gap while electricity is available to everyone. Farmers too far from the national power grid may not have access to power for their crops.

**KEY FINDINGS**

- **Tourism/Economy**: The Tourism grid has more electricity than what the native Cubans receive. Those associated with the tourism industry are afforded a higher quality of life, as the growing sector allows for a higher income. The majority of those who graduate with any degree end up either involved with the military, healthcare, or the tourism sectors as they are most in-demand.

- **Lifestyle**: In attempts to save energy, scheduled and unscheduled blackouts are experienced. Electricity is only used for basic necessities; e.g. cooking, small appliances use like television, radio, fan, phone. Electric washers and dryers are not common appliances in the city or country. In the country, people used either gas-powered harvesting tools or oxen for farming. Horses are often used for transportation.

- **Sustainability**: As Venezuelan oil production is decreasing, the amount of subsidized oil imported to Cuba is also decreasing. Cuba has resorted to fracking to extract oil along the coastal region. Foreign companies and other governments are collaborating with the Cuban government to produce electricity. The use of old oil burning equipment are contributing to the oil shortage by causing less-efficient fuel burning.

Different types of energy are used depending on what region people live in, and electricity is available to everyone. Farmers too far from the national power grid may not have access to power for their crops.

**CONCLUSION**

Until now, electrical autonomy has not been possible for Cuba. Relying solely on other countries to import petroleum has led to two instances where an unexpected decrease of imports caused Cuba to nearly collapse. In order to protect against another infrastructure collapse and to increase domestic energy production, Cuba is trying to diversify its energy portfolio in both types of electricity production and foreign partnerships. Meanwhile, the exploitation of the tourism industry as a main source of income is greatly affecting lifestyle by creating inequality of electric resources. The decrease in oil imports, and therefore the shortage of electric power has made this inequality more pronounced. The exploitation of solar, wind, and other renewable resources in the areas in which they are best suited can create a more even distribution of resources, boost the economy outside of tourism, and pre-
